

FIELD TRIAL
BULK GYPSUM— GYP-FLO COMPARISON

The above graph represents a common result for both products. Gyp-Flo contains high levels of available Calcium (>80%) to reduce the Exchangeable Sodium Percentage. Bulk Gypsum contains high total amounts of Calcium, but due to its low solubility of .24% and average particle size of 1000 micron, it is generally not as effective in reducing sodium.

The quality of irrigation water and type of fertiliser will affect the long term results of both bulk gypsum and Gyp-Flo.
